

SERVER

BACKGROUND OF THE INVENTION

(1) Field of the Invention

5 This invention relates to a server and, more particularly, to a server for performing a process corresponding to requests from a plurality of clients.

(2) Description of the Related Art

10 In recent years services to provide the processing function of an application program stored in a server to a client via Internet have been proposed.

 Fig. 14 is a view showing the configuration of such a system. In Fig. 14, a server system 1 comprises a memory 1a for storing application programs and data bases (DB) and a server 15 1b.

 A network 2 is Internet and transfers information between the server system 1 and clients 3a, 3b, and 4a.

 Client systems 3 and 4 are located in A Company and B Company respectively and consist of the clients 3a and 3b and 20 the client 4a respectively.

 In this system, when a user starts a predetermined application program from the client 3a and performs a predetermined process on his/her company's (A Company's) information stored in a DB, he/she logs in the server system 25 1 by inputting his/her user ID and password and performs the process by starting a desired application program.

 In such a conventional system, an environment set by

a user is saved in the server system 1. Therefore, a user who has already set an environment can use an application program from any client in the same environment, which can save the trouble of setting an environment for each client.

5 In a conventional system, however, settings unique to each client, such as ones for an output printer and monitor resolution, also have been managed by associating them with a user. Therefore, when a user who set an environment on, for example, the client 3a moves to the client 3b to work, he/she
10 will need to newly set an environment, such as a printer, suitable for the client 3b. This is troublesome.

SUMMARY OF THE INVENTION

 In order to address such a problem, the present invention
15 was made. In other words, an object of the present invention is to provide a server that holds suitable environment settings for individual clients and can provide comfortable operating environments.

 In order to achieve the above object, a server for
20 performing a process corresponding to requests from a plurality of clients is provided. This server comprises environment setting information storing means for storing environment setting information regarding each client, client specifying means for specifying, in the case of a request for a process
25 having been made from a predetermined client, the client which made the request, environment setting means for obtaining environment setting information corresponding a client

specified by the client specifying means from the environment
setting information storing means and setting the corresponding
environment, and processing means for performing a process
corresponding to the request on the basis of an environment set
5 by the environment setting means.

The above and other objects, features and advantages
of the present invention will become apparent from the following
description when taken in conjunction with the accompanying
drawings which illustrate preferred embodiments of the present
10 invention by way of example.

BRIEF DESCRIPTION OF THE DRAWINGS

15

DESCRIPTION OF THE PREFERRED EMBODIMENTS

An embodiment of the present invention will now be described with reference to the drawings.

Fig. 1 is a view for describing the operating principle
20 of a server according to the present invention. As shown in Fig. 1, a server 20 according to the present invention comprises a communication processing section 20a, client specifying means 20b, environment setting information storing means 20c, environment setting means 20d, and processing means 20e and
25 performs a process corresponding to a request sent from clients 22-1 through 22-3 via a network 21.

The communication processing section 20a performs

protocol or format conversion when information is sent or received via the network 21.

The environment setting information storing means 20c stores environment setting information regarding each client.

5 When a predetermined client made a request for a process, the client specifying means 20b specifies the client which made the request.

10 The environment setting means 20d obtains environment setting information corresponding a client specified by the client specifying means 20b from the environment setting information storing means 20c and sets the corresponding environment.

15 The processing means 20e performs a process corresponding to a request on the basis of an environment set by the environment setting means 20d.

The network 21 consists of, for example, Internet and sends information to or receives information from the clients 22-1 through 22-3.

20 The clients 22-1 through 22-3 consist of, for example, a personal computer, send a request corresponding to a user's operation to the server 20 via the network 21, and receive and display the result of the request.

Now, operation in Fig. 1 will be described.

25 First, operation performed when environment setting information is set will be described. Only an administrator having special authority can set environment setting information.

It is assumed that an administrator accesses the server 20 and requests permission to input environment setting information. The client specifying means 20b gives him/her permission to input environment setting information only when
5 it could confirm him/her as a regular administrator. Environment setting information is information for specifying monitor resolution and an output printer for each client.

An administrator who was permitted to input environment setting information inputs environment setting information for
10 each of the clients 22-1 through 22-3 from, for example, the client 22-1. Environment setting information input is sent to the server 20 via the network 21 and is stored in the environment setting information storing means 20c.

Environment setting information has been set now.
15 It is assumed that an ordinary user accesses the server 20 from the client 22-2 in such a situation. The client specifying means 20b in the server 20 specifies a client which accessed it, by referring to, for example, an Internet protocol (IP) address. In this example, a source address added to a header
20 for a packet sent from the client 22-2 is referred to and a client which accessed the server 20 is specified as the client 22-2.

The environment setting information storing means 20c reads out environment setting information corresponding to a client specified by the client specifying means 20b and provides
25 it to the environment setting means 20d.

The environment setting means 20d sets an environment in compliance with environment setting information supplied from

the environment setting information storing means 20c. As stated above, specific items set as an environment include monitor resolution and an output printer.

As a result of the above processes, an environment
5 corresponding to the client 22-2 will be set.

Next, it is assumed that a user made a request from the client 22-2 to perform a predetermined process. This request is received by the communication processing section 20a in the server 20 and is provided to the processing means 20e.

10 The processing means 20e performs a process corresponding to the request on the basis of an environment set by the environment setting means 20d. For example, if a request to display a predetermined screen is made, then the processing means 20e generates data for displaying the screen, converts
15 data for displaying an image in compliance with resolution set by the environment setting means 20d, and sends a reply to the client 22-2 which made the request. If a request to print out predetermined data is made, then the processing means 20e generates data for printing out and sends it to a printer
20 designated by environment setting information.

If requests are made from the other clients 22-1 and 22-3, an image is displayed with resolution set for each of them or data is output to a printer set for each of them.

As described above, a server according to the present
25 invention registers and manages environment setting information according to clients, so environment setting unique to each client is constant for different users. This enables to build

a system with high operability.

An embodiment of the present invention will now be described.

Fig. 2 is a view showing the configuration of an embodiment of the present invention. In Fig. 2, a server 40 starts the appropriate application program and provides services, in response to a request from clients 43-1 through 43-3, 44-1, and 44-2.

The server 40 comprises a central processing unit (CPU) 40a, a read only memory (ROM) 40b, a random access memory (RAM) 40c, a hard disk drive (HDD) 40d, and interfaces (I/F) 40e and 40f. Furthermore, DBs 41-1 through 41-3 are externally connected to the server 40.

The CPU 40a controls each section of the apparatus in compliance with control programs etc. stored in the HDD 40d, starts an application program corresponding to a request from the clients 43-1 through 43-3, 44-1, and 44-2, and performs a process requested.

The ROM 40b stores basic programs executed by the CPU 40a and data.

The RAM 40c temporarily stores programs being executed by the CPU 40a and data being operated by the CPU 40a.

The HDD 40d stores control programs executed by the CPU 40a, application programs started in response to a request from the clients 43-1 through 43-3, 44-1, and 44-2, and the like.

The I/F 40e performs protocol or data conversion when data is sent to or received from the clients 43-1 through 43-3,

44-1, and 44-2 via a network 42.

The I/F 40f consists of, for example, a small computer system interface (SCSI) etc. and sends data to or receives data from the DBs 41-1 through 41-3.

5 The DBs 41-1 through 41-3 consist of, for example, an HDD etc. and store data for each company individually.

The network 42 consists of Internet etc. and transmits data between the clients 43-1 through 43-3, 44-1, and 44-2 and the server 40.

10 The clients 43-1 through 43-3, 44-1, and 44-2 consist of, for example, a personal computer and can make requests for various processes by starting browser software stored in their built-in HDDs and logging in the server 40.

Operation in the above embodiment will now be described.

15 Functions achieved by the embodiment of the present invention will be described briefly, then operation will be described in detail.

Fig. 3 is a view showing an example of how the above embodiment is applied. As shown in Fig. 3, the server in this embodiment divides objects to be managed into the three hierarchies of "user," "client," and "company" and manages them. For example, the clients 43-1 through 43-3 belong to A Company and users U1 through U7 belong to the clients 43-1 through 43-3.

Fig. 4 is a view showing the contents of an environment set for each of the clients shown in Fig. 3 which belong to A Company. In an example shown in Fig. 4, the monitor resolution for the client 43-1 is set to "1024 x 768" and the output printer

is set to "printer A". The monitor resolution for the client 43-2 is set to "800 x 600" and the output printer is set to "printer B". The monitor resolution for the client 43-3 is set to "1024 x 768" and the output printer is set to "printer C".

5 Environment setting information regarding each client is associated with its client ID, as shown on the right side of Fig. 4, and is stored in the server 40.

In this embodiment, as shown in Fig. 5, the status and log-in time of each client are also managed by the server 40.
10 For example, if the client 43-3 contracts a virus, the communication of the virus can be prevented by changing the state of "Permission for Use" from "Yes" to "No" to prohibit the client 43-3 from logging in. In addition, the status (used or unused) and log-in time of each client can be monitored in real time.
15 Therefore, if any problem has arisen, it can be solved quickly by specifying a client which is in the process of access.

As stated above, in the embodiment of the present invention, information indicating the contents of an environment set for each client and information regarding logging in the
20 server 40 are managed as environment setting information by the server 40 and various processes described later are performed in compliance with this environment setting information.

Fig. 6 is a view showing an example of actual environment setting information stored in the HDD 40d in the server 40. As
25 shown in Fig. 6, "Permission for Use," "Status," "Log-in Time," "Printer Name," and "Monitor Resolution," which are associated with the client IDs of clients belonging to A Company or B Company,

are stored as environment setting information. In this example, all these pieces of information together are stored in the HDD 40d. However, they may be divided according to companies and be stored severally in the DBs 41-1 through 41-3.

5 Now, operation in the embodiment of the present invention will be described in detail.

 First, operation performed when an administrator sets environment setting information shown in Fig. 6 will be described concretely. For example, it is assumed that an administrator
10 of A Company operates the client 43-1 and starts an application program for setting an environment. A screen which looks like the one shown in Fig. 7 will be displayed on the display device of the client 43-1. In this case, this administrator is certified as a regular one and belonging to A Company by his/her password
15 and ID.

 On this screen, a window 60 titled "Setting Screen for Administrators of A Company" is displayed and clients belonging to A Company are listed in its display area. Check boxes 60a through 60c for changing the state of Permission for Use for
20 each client are displayed to the left of the list. DETAILS buttons 60d through 60f operated when detailed setting information regarding each client is input are displayed to the right of the list.

 On this screen, it is assumed that a check mark inside
25 the check box 60c is cleared and that an OK button 60g is operated. This information is sent to the server 40 and the CPU 40a changes the appropriate item included in environment setting information.

As a result, the item "Permission for Use" for client 00003 shown in Fig. 6 will be changed from "Yes" to "No".

Furthermore, when the DETAILS button 60d on this screen is operated, a screen which looks like the one shown in Fig. 8 will appear.

This screen is a setting screen for the client 43-1. In this example, a window 70 titled "Setting Screen for Client 00001" is displayed. In its display area, an area 70a for displaying setting information regarding a printer, an area 70c for displaying setting information regarding a monitor, an OK button 70e, and a CANCEL button 70f are displayed.

On this screen, a desired printer name or desired resolution is entered in a text box 70b or 70d and the OK button 70e is operated. By doing so, an output printer or monitor resolution for the client 43-1 can be set.

The above operation enables an administrator to set a using environment for a client.

When environment setting is completed in this way, ordinary users can log in the server 40 via each client to make a request for a process. Operation performed in that case will now be described.

For example, it is assumed that a user has accessed the server 40 from the client 43-1. The CPU 40a refers to his/her user ID and password in order to confirm whether he/she is a regular user or not.

If he/she is confirmed as a regular user, then the CPU 40a reads out the file "Cookie" stored in the client 43-1 and

specifies the client from which he/she logged in by referring to information stored in the file. In this example, the CPU 40a will specify the client from which the user logged in as the client 43-1. "Cookie" is set by, for example, an administrator after a contract is concluded between a person who provides services by the use of the server 40 and A Company.

After client authentication is completed, the CPU 40a reads out the appropriate environment setting information from the HDD 40d and sets its environment. That is to say, the CPU 40a reads out the first piece of information shown in Fig. 6 corresponding to the client 43-1 from among environment setting information stored in the HDD 40d. Then the CPU 40a sets the output printer to printer A and the monitor resolution to 1024 x 768 in compliance with the information read out.

Next, the CPU 40a generates an HTML document which indicates application programs, being available in compliance with the contract with A Company, as icons, and sends it to a client which made a request. As a result, a screen which looks like the one shown in Fig. 9 will be displayed on the display device of the client 43-1.

In this example, a window 80 titled "ASP" is displayed. In its display area, an address pad 80a, a note pad 80b, computer aided design (CAD) 80c, and accounting 80d are displayed. The types of icons displayed on this screen correspond to the contents of a contract concluded between a person who provides services by the use of the server 40 and A Company.

On this screen, it is assumed that a user specified the

accounting 80d with a pointer 85. The client 43-1 sends the server 40 information indicating that the accounting 80d was specified.

5 The CPU 40a in the server 40 starts the appropriate application program stored in the HDD 40d. Then the CPU 40a converts data for a screen to be displayed as a result of the start into data for a screen with resolution of "1024 x 768" in compliance with environment setting information for the client 43-1 and sends it to the client 43-1.

10 As a result, a screen which looks like the one shown in Fig. 10 will appear on the display device of the client 43-1. In this example, a window 90 titled "Accounting" is displayed. Buttons for executing various commands are displayed at the top of the window 90. In its display area, cells for performing
15 accounting are displayed.

A user can perform an objective process by operating a desired button on this screen.

If a PRINT button 90a on this screen is operated, then information indicating that the PRINT button 90a was operated
20 is sent from the client 43-1 to the server 40.

The CPU 40a in the server 40 perceives that the PRINT button 90a was operated on the client 43-1, and generates print data. Then the CPU 40a refers to a printer name included in environment setting information, specifies an output printer
25 for the client 43-1, and sends print data generated to the appropriate printer. In this example, data is sent to printer A.

The above processes enable information generated by an application program to be output to a printer designated by environment setting information.

In this embodiment, an administrator on the client side
5 can refer to information regarding his/her company's client which has logged in the server 40. The operational procedure and operation for doing this will now be described.

It is assumed that an administrator of A Company logs in the server 40 and that he/she makes a request to display a
10 screen indicating the log-in state of a client belonging to A Company. The server 40 obtains data regarding A Company from among environment setting information stored in the HDD 40d and sends it to the client which made the request.

As a result, a screen which looks like the one shown
15 in Fig. 11 will appear on the administrator's display device. In this example, a window 100 titled "Client State Monitoring Screen for Administrators of A Company" is displayed. In a display area 100a, the state of clients belonging to A Company is listed. Moreover, at the bottom of the window 100, an OK
20 button 100b operated to close the window 100 is displayed.

An administrator can monitor the state of each client by referring to such a screen.

Finally an example of processes performed in the above embodiment will be described.

25 Fig. 12 is an example of processes performed in the server 40 when an administrator made a request to set an environment. The following procedure will be performed in compliance with

this flow chart.

[S1] The CPU 40a confirms whether or not an administrator who made a request is a regular one. To be concrete, the CPU 40a confirms whether or not an administrator who made a request
5 belongs to a company which intends to change settings and whether or not he/she has a rightful position as an administrator.

[S2] The CPU 40a judges whether or not he/she is a regular administrator. If he/she is a regular administrator, the CPU 40a proceeds to step S3. If he/she is not a regular administrator,
10 the CPU 40a ends the procedure.

[S3] The CPU 40a obtains environment information corresponding to the administrator from the HDD 40d.

[S4] The CPU 40a displays a setting screen for administrators which looks like the one shown in Fig. 7 to the
15 administrator who made a request.

[S5] The CPU 40a judges whether or not setting is completed. If setting is completed, the CPU 40a proceeds to step S6. If setting is not completed, the CPU 40a repeats step S5.

[S6] The CPU 40a obtains contents set on the setting
20 screens for administrators shown in Figs. 7 and 8.

[S7] The CPU 40a stores the pieces of information obtained in the appropriate areas of the HDD 40d.

The above procedure enables an administrator to set environment setting information freely.

25 Now, a procedure performed when an ordinary user logs in the server 40 and performs a desired process will be described with reference to Fig. 13. This flow chart will be performed

when a user logs in the server 40.

[S10] The CPU 40a obtains the file "Cookie" stored in the memory of a client which made a request.

[S11] The CPU 40a refers to information stored in "Cookie," specifies the client which made a request, and confirms whether or not the client is a proper one.

[S12] The CPU 40a judges whether the client is a proper one. If the client is a proper one, the CPU 40a proceeds to step S13. If the client is not a proper one, the CPU 40a ends the procedure.

[S13] The CPU 40a obtains environment setting information corresponding to the specified client from the HDD 40d.

[S14] The CPU 40a judges whether the item "Permission for Use" included in environment setting information is "Yes". If it is "Yes," the CPU 40a proceeds to step S15. If it is not "Yes," the CPU 40a ends the procedure.

[S15] The CPU 40a sets "Monitor Resolution" in compliance with environment setting information.

[S16] The CPU 40a sets "Printer Name" in compliance with environment setting information.

[S17] The CPU 40a changes "Status" included in environment setting information from "Unused" to "Used".

When an ordinary user operates a predetermined client and logs in the server 40, an environment corresponding to the client will be set in compliance with the above procedure.

In the above embodiment, only information regarding a

client is stored as environment setting information. However, information regarding each user can also be stored to set an environment in compliance with this information and the above environment setting information. This method enables to change
5 settings according to users without changing settings unique to each client.

In the above embodiment, a client is specified on the basis of information stored in "Cookie," but the present invention is not limited to such a case. For example, a client
10 can be specified on the basis of an address given to a packet sent from the client.

Finally the above procedure can be achieved with a computer. In that case, the contents of a function which a server must have are described in a program recorded on a record medium
15 which can be read with a computer. The above procedure is achieved with a computer by executing this program on the computer. A record medium which can be read with a computer can be a magnetic recording medium, a semiconductor memory, or the like. In order to place this program on the market, it can be stored on a portable
20 record medium, such as a compact disk read only memory (CD-ROM) or a floppy disk. Alternatively, it can be stored in a memory of a computer connected via a network and be transferred to another computer via a network. When this program is executed on a computer, it is stored on a hard disk etc. in the computer and
25 is loaded into a main memory.

As described above, a server for performing a process corresponding to requests from a plurality of clients according

to the present invention comprises environment setting
information storing means for storing environment setting
information regarding each client, client specifying means for
specifying, in the case of a request for a process having been
5 made from a predetermined client, the client which made the
request, environment setting means for obtaining environment
setting information corresponding a client specified by the
client specifying means from the environment setting information
storing means and setting the corresponding environment, and
10 processing means for performing a process corresponding to a
request on the basis of an environment set by the environment
setting means. This can save a user the trouble of changing
environment settings, which is taken each time he/she moves to
another client.

15 The foregoing is considered as illustrative only of the
principles of the present invention. Further, since numerous
modifications and changes will readily occur to those skilled
in the art, it is not desired to limit the invention to the exact
construction and applications shown and described, and
20 accordingly, all suitable modifications and equivalents may be
regarded as falling within the scope of the invention in the
appended claims and their equivalents.
